Enterprise Information Security & AI Usage Policy

1. Data Classification Levels

- **Public**: Marketing content, published blog posts, public documentation.

- **Internal**: Internal engineering memos, roadmap presentations, sprint backlogs.

- **Confidential**: Proprietary algorithms, customer behavioral churn records, unredacted telecommunications telemetry.

- **Restricted**: PII (Personally Identifiable Information), customer payment cards, healthcare records, AWS IAM root credentials.

2. Generative AI & Cloud Services Policy

Employees interacting with foundation models (LLMs) or retrieval systems must ensure:

- Zero customer PII or raw authentication keys are submitted to public chatbots.

- Enterprise-approved generative AI services (such as Amazon Bedrock Claude 3.5 Sonnet inside private VPC endpoints) are strictly required for corporate data synthesis.

- Vector embeddings generated via Amazon Titan Text Embeddings V2 must be stored within encrypted OpenSearch Serverless collections with strict AWS IAM and data access policies.

3. Device Security Standards

All corporate laptops must utilize FileVault/BitLocker full-disk encryption, active CrowdStrike Falcon EDR endpoint protection, and enforce 15-minute screen lockouts.
